Visually See Active Components in an Engine

Above is the image of the engine and its various components. Several of the main systems are pointed out through arrows. These are the main components to check when the automobile is not starting. These various components control the entire system what ultimately makes up the process for starting a vehicle. These various components are located throughout the engine bay and are strategically located based on the size of the engine bay, their function, and connection with other components. Any one of these components can keep a vehicle from starting and going through component by component allows a user to better solve the issue of the vehicle not starting.

The one on the left show a bit more detailed inside the actual engine bay and it various components. The right has a bit of an overview of what is seen.
